This is a bug fix update. I am resending this one. Also, i just realized that the last one I sent is missing a few files. So if you didn't get those files please send me an email and i'll send them to you. This is the update for IDM.6.xx.0.1 SND.zip. It contains only one change. Fixed the 'Only Activate at Startup' script, it doesn't work because it activates idm.6.xx.0.2 with the vista pack.Q: What is the motivation for creating a user for http_referer? I've been exploring the Linux kernel lately, but haven't yet

managed to find an explanation for the existence of `http_referer`. Why should we provide a value for a URL parameter that doesn't seem to be used anywhere? Is there a reason why the Linux kernel uses this instead of simply hardcoding the home page of their website? A: It appears to be the user agent string (or some user agent) for the module `http_referer`. This user agent string is defined as: `#define HTTPREFERER_STRING "HTTP_REFERER"` source: In this case, `http_referer` is an output of the `printk` function, which may be to display the string (like `printk("%s ", http_referer)`) or to use it as a format string for `printf`. I'm not sure exactly what this is used for, but it's probably not a regular use-case. I guess it's defined so that people can use your module with their own homepages, without having to re-compile their kernel to add another kobject. edit: If you're wondering, the homepages will be set to `"/index.html"` and `"/kernel.org/"`. Adam Lambert receives Lifetime Achievement Award Adam Lambert has accepted a lifetime achievement award at the NAACP Image Awards in LA. The 'What About Us' singer, who is nominated in the Outstanding Male Artist category for his latest LP 'Trespassing', was given the award on Sunday (26.02.12) during the ceremony. Accept 82157476af
